

Abstract

The application describes a method and system for controlling a processing of video data such that said video data may be transmitted over a connection in a communication network (I,II), where said connection employs a plurality of protocol layers (L1, L2; AL, NL/TL, LL). The processing of video data for transmission is performed at a first layer (L1; AL). A value or values of one or more transmission condition parameters indicative of transmission conditions in the network (I, II) are acquired, where these transmission condition parameters are specific for a second layer (L2; NL/TL, LL) provided lower than said first layer (L1; AL). Then one or more values of one or more video control parameters usable at said first layer (L1; AL) are derived from said value of said at least one transmission condition parameter and the processing of video data is performed in accordance with the derived one or more values.
